

Protect your health and home with a water filtration system

Do you know the quality of the water in your home?

85% of American homes have hard water, according to the U.S. Geological Survey. Some of the highest levels are in Southern California. Hard water is water with high levels of calcium and magnesium.

Hard water can cause issues by:

- leaving hard-to-remove spots on plumbing fixtures and dishes;
- reducing the effectiveness of soap and detergent;
- fading and staining laundry;
- drying out skin and hair;
- leaving scale buildup in boilers; and
- clogging pipes.

Fortunately, hard water can be softened. A whole-house water filtration system that uses reverse osmosis is an ideal solution for California homes with very hard water. Not only does it soften hard water, but it also removes any unusual odors, tastes and colors without using sodium substitutes. This system protects your health and home with clean, pure water.
